

# Hookup Diagrams

## TRACKING

This diagram demonstrates how to use three MIC/LINE 4 cards, providing up to 24 microphone and instrument inputs (12 Mic/Line inputs and 12 Line inputs). Three DIGI cards provide 24 output tracks to a hard disk recorder via ADAT optical connections. The MIDI IN/OUTs provide MMC (MIDI Machine Control) to the hard disk recorder and MTC (MIDI Time Code) to the dxb. A LINE card provides line-level sends and returns for external effects, and the MIX OUT card provides two stereo line-level control room outputs (1=NEAR; 2=MAIN) and two stereo headphone outputs for monitoring the input sources.

After getting your tracks down, the three DIGI cards provide inputs for 24-tracks from the hard disk recorder via ADAT optical connections. The MIDI IN/OUTs provide MMC (MIDI Machine Control) to the hard disk recorder and MTC (MIDI Time Code) to the dXb. A LINE card provides up to eight line-level sends for monitoring the mixdown in either stereo (L/R Mix) or surround sound. You can use the AES/EBU or S/PDIF outputs (or the analog MIX OUT) from the MIX OUT card to record a stereo mixdown, or one of the ADAT optical outputs to record the surround stems to a digital multitrack recorder.

**DIGITAL AUDIO WORKSTATION (DAW)**

This example demonstrates how to use the aXb with a digital audio workstation (DAW). Three MIC/LINE 4 cards provide up to 24 microphone and instrument inputs (12 Mic/Line inputs and 12 Line inputs). Three AES cards provide 24 output tracks to the DAW's audio interface via 25-pin AES/EBU connections. The SMPTE IN/OUTs on the SYNC card provide time code for the DAW. A LINE card provides line-level sends and returns for external effects, and the MIX OUT card provides a stereo line-level control room output and two stereo headphone outputs for monitoring the input sources.
